

# OpenText Core for Trading Grid

Achieve 100 percent digitization of your partner community with a simple, folder-based application to improve B2B transaction visibility and management

**Connect to non-EDI business partners digitally**

**Improve transaction visibility**

**Increase business process efficiency**

**Provide partners with a familiar file sharing experience**

**Many companies have established a streamlined B2B program to digitally connect with their trading partners and corporates, yet most are still receiving a significant amount of emails, faxes and paper documents that require time-consuming, manual processing.**

Ideally, business partner digitization solutions should be easy to adopt and use and provide business benefits to all parties. OpenText™ Core for Trading Grid provides a unique solution that enables a company's trading partners and corporates to easily drag and drop purchase orders, payment files or other documents, such as screen shots or design files, into a folder-based application. This gives both parties a streamlined process and better visibility into their transactions. This solution is available to OpenText™ B2B Managed Services customers.

## **Connect to non-EDI business partners digitally**

Digitizing all partners has never been easier. With Core for Trading Grid, onboarding new trading partners and corporates is as easy as sending an email invitation. Partners simply need to accept the invitation to start exchanging files digitally.

## Improve transaction visibility

When a business partner drops a file into the Core for Trading Grid outbox, the file flows through to OpenText™ Trading Grid and then on to the B2B Managed Services customer, just like any other transaction file. Core for Trading Grid transactions can be searched for, tracked and viewed alongside all other digital transactions within a single visibility dashboard in Active Documents. Similarly, the business partner has the benefit of visibility, via a Core web user interface for sending and receiving files and viewing files and errors.

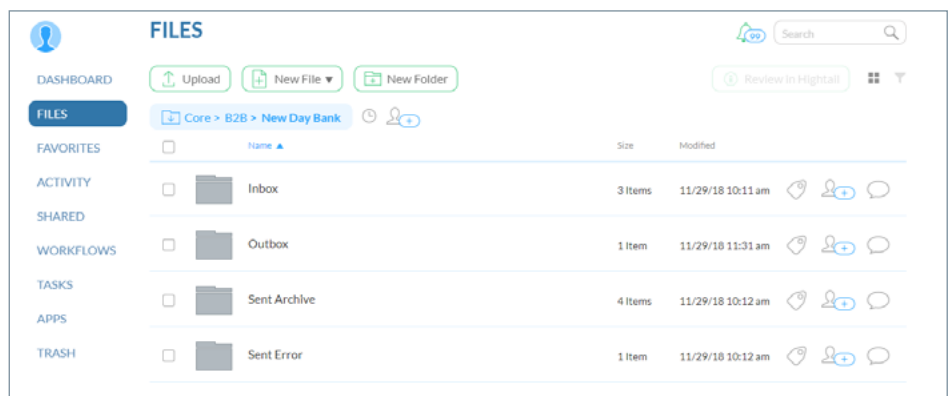

## Increase business process efficiency

Core for Trading Grid offers a way for non-EDI documents to be handled in the same streamlined way as EDI and other digital documents. B2B Managed Services customers may already have data transformation included in their service, which allows structured documents to be transformed into machine-readable data and automatically populated into internal business systems. By enabling digital connectivity with all trading partners and corporates, companies take full advantage of IT and ERP investments and efficiencies.

## Provide partners with a familiar file sharing experience

Core for Trading Grid eases business partner adoption by providing three methods for exchanging files. In addition to the web-based portal, Core for Trading Grid has a desktop sync application, that allows a business partner to drag and drop files into a Core folder. A mobile app allows a file to be sent from a mobile device, or a photo to be taken and transmitted, much like depositing a check for mobile banking.

Core for Trading Grid is the only product of its kind that transfers documents to and from small businesses using familiar, non-technical processes that ease partner adoption.
